

Plexii 3.1 — Test Script

Browsing, research, and the things you have open

Build	PlexiDesk 3 Preview · released to main
Commit	ad53be71
Date	2026-09-21
Sections	9

How to use this. Each section covers one feature: what it is, why it exists, and the steps to exercise it. Work through them in order — several build on the one before.

The screenshots are the real build, and every numbered marker was measured from the running app, so a circle sits on the actual control you need to click.

Record a result for each section. If something fails, note what you saw rather than what you expected — the gap between the two is the useful part.

Where AI is involved, check it against the source. Nothing should appear in a table that is not on the page it came from.

1 The Browser is an app in PlexiOffice

- 1 Browser tile 2 Browser under APPS

WHAT IT IS

A full web browser that lives in Office alongside PlexiDocs and PlexiSheets, rather than only as a widget on a desk.

WHY IT MATTERS

Browsing is usually something you do BESIDE your work — looking something up, keeping a reference open across several desks, reading documentation. Before this it had nowhere to live but a desk it had nothing to do with, so people left Plexii and used Chrome. It was previously filed under "Communicate", where nobody looked for it.

HOW TO TEST IT

1. Click **Office** in the top-left switcher, then **Home**.
2. Find the **Browser** tile in the app grid, eighth along beside PlexiMeet.
3. Check the sidebar: **Browser** is listed under **APPS**, after PlexiDraw — NOT under COMMUNICATE.

Passes if: The Browser appears both as a tile on the Office home grid and under the APPS heading in the sidebar.

Result: ☐ Pass ☐ Fail Notes: _____

2 Browsing without a desk

1 Ask Plexii 2 Send to desk 3 Open tray

WHAT IT IS

The same browser core the desk widget uses — history, search-engine picker, address bar — with no desk attached.

HOW TO TEST IT

1. Click the **Browser** tile. A real page loads.
2. Type a URL or a search into the address bar and press Enter.
3. Note **Ask Plexii** and **Send to desk** in the toolbar.
4. Look at the tray above the footer: **Browser** is listed there.

WHY IT MATTERS

One browser engine, so a fix in either place fixes both. The page you were last on is remembered per device, so reopening Office puts you back where you were.

Passes if: Pages load and navigate normally, and "Browser" appears in the tray as something you have open.

Result: ☐ Pass ☐ Fail Notes: _____

3 Ask Plexii to work on the page

- 1 Type a task 2 Summarise 3 Images 4 Extract data

WHAT IT IS

An AI agent that drives the page for you — reading, scrolling, clicking, following links — with six one-click presets.

WHY IT MATTERS

A blank box asks you to guess both what the agent can do and how to phrase it. The presets are fully-formed tasks: "Summarise" alone would produce a run that reads one screenful and stops. Every preset also tells the agent what to RECORD, because the findings are the whole yield.

HOW TO TEST IT

1. Click **Ask Plexii** in the browser toolbar.
2. Type your own instruction, or...
3. Click a preset: **Summarise**, **Links**, **Images**, **Extract data**, **Find similar** or **Research**.
4. Watch the run appear at the bottom with its live narration, running cost and a **Stop** button.

Passes if: A run starts, narrates each step, shows its cost, and can be stopped at any moment.

Note: Plexii never signs in, pays, or moves files. It also never answers cookie dialogs on your behalf — it hides them so it can read the page underneath.

Result: ☐ Pass ☐ Fail Notes: _____

4 Guide a run while it works

1 Guidance box 2 Send 3 Stop

WHAT IT IS

A box that lets you add instructions to a run that is already going, without restarting it.

WHY IT MATTERS

Browsing is the one kind of AI work you sit and WATCH, so you see it heading somewhere useless a minute before it finishes. Previously the only controls were Stop and start again — which threw away everything it had found. Your words are treated as an UPDATE to the task, so findings are kept; say plainly that you want it to change course and it will.

HOW TO TEST IT

1. While a run is going, type into the guidance box, e.g. *"only UK suppliers, skip the blog posts"*.
2. Press **Enter** or click **Send**.
3. Confirmation reads "Passed on — it will pick this up on its next step."
4. Watch the next step: the run should narrow, not start over.

Passes if: The run adjusts on its next step and keeps everything it had already found.

Result: ☐ Pass ☐ Fail Notes: _____

5 Choose where the results go

- 1 Put on a desk 2 Pick the desk

WHAT IT IS

When a run finishes, you pick which desk its results land on.

WHY IT MATTERS

It used to use whichever desk was last ACTIVE — from a desk-less browser, one you were not looking at — and with no active desk at all it failed outright, after the run had already been paid for. The desk you were last on is offered first.

HOW TO TEST IT

1. Let a run finish. It shows what it found.
2. Click **Put on a desk...**
3. Pick a desk from the list.

Passes if: The results land on the desk you chose, and on no other.

Result: ☐ Pass ☐ Fail Notes: _____

6 Research arrives as a usable table

WHAT IT IS

A list of things becomes a real table widget; the prose answer becomes a note beside it.

WHY IT MATTERS

The findings were previously handed BACK to an AI model to retype as a table, which truncated long runs inside the reply limit — so the more research a run did, the more was lost — and let a model round a price it had never seen. The table is now built directly from the data, verbatim, with every row. Column types come from the VALUES: a rating of 4.8 becomes a number column, a URL stays clickable text.

HOW TO TEST IT

1. Open the desk you chose.
2. Check the table: every result should be present — compare the row count against what the run reported.
3. Check the column types: numbers right-aligned with a # marker, URLs still readable as links.
4. Read the note beside it for the run's conclusion.
5. Switch the table to **Cards**, **Kanban** or **Gantt** — it is a full table, not a picture of one.

Passes if: Every row the run found is in the table, values match the source pages exactly, and nothing has been invented.

Result: ☐ Pass ☐ Fail Notes: _____

7 The tray — everything you have open

1 Everything you have open

WHAT IT IS

A strip above the footer listing every desk, document, chat and app you currently have open, across all four segments.

WHY IT MATTERS

The app navigates rather than opens: each destination replaces the last. That suits a tool used one thing at a time, and not one where a desk, the document written from it and the chat about it are the same piece of work. Switching is now a click instead of a retrace.

HOW TO TEST IT

1. Open several things: a desk, a document, Mail, and an app from PlexiBrain or PlexiDesk.
2. Each appears in the tray under its own name and icon.
3. Click any tab to switch straight to it.
4. Hover a tab and click **x** to close it — this only clears the tab, it deletes nothing.
5. Right-click a tab for **Pin**, **Close the others** and **Close all**.

Passes if: Everything you open is listed and one click away. Closing a tab never deletes the thing itself.

Result: ☐ Pass ☐ Fail Notes: _____

8 File a document onto a desk

1 Drag this document row... 2 ...onto a desk tab here

WHAT IT IS

Drag any document — doc, sheet, slides, diagram, design or drawing — onto a desk tab in the tray, or right-click its tray tab and choose a desk by name.

WHY IT MATTERS

A drag with no visible affordance is a feature nobody finds, so there is a menu too. The widget POINTS AT the document rather than copying it: editing it on the desk and editing it in Office are the same file. It lands on the desk you chose even if that desk is not open.

HOW TO TEST IT

1. In Office, hover any document row — the tooltip says you can drag it onto a desk.
2. Drag it onto a desk tab in the tray. The tab highlights as you hover.
3. Or: open the document, right-click its tray tab, and pick a desk under **Send to desk**.
4. Open that desk and confirm the document is there.
5. Edit it on the desk, then open it in Office — the change is in both.

Passes if: The document appears on the chosen desk and is the SAME file, not a copy.

Result: ☐ Pass ☐ Fail Notes: _____

9 Documents open with the panel out of the way

1 Bring the panel back 2 Outline

WHAT IT IS

The outline / comments / assistant panel starts minimised, and remembers your choice once you change it.

WHY IT MATTERS

It used to start open on every surface, spending a slice of every document's width on panels nobody had asked for — worst on a desk, where a document widget has least room to give.

HOW TO TEST IT

1. Open any document.
2. The full width is the document. No panel.
3. Click **Outline**, **Comments** or **Panel** in the toolbar to bring it in.
4. Close and reopen the document — your choice is remembered.

Passes if: Documents open with full width; the toggles work; the preference persists.

Result: ☐ Pass ☐ Fail Notes: _____
